1. Overview

Sci-Fi Wall Panel 03 (Dark Industrial) is a set of 5 seamless, tileable sci-fi wall panel PBR textures for Unity, each provided in a clean and a damaged (rust/wear) variant, for a total of 10 unique textures. The style features dark industrial metal panels with emissive neon accent details.

2. Package Contents

10 unique textures (5 base variants, each with a clean and a damaged version). Every texture includes a full PBR map set at 4096x4096 (4K) resolution:

Map	Description
BaseColor	Albedo / diffuse color
Normal	Tangent-space normal map
MaskMap	R = Metallic, G = Occlusion, A = Smoothness (Unity URP Lit packing)
Height	Height map, for Parallax mapping
Emission	Emissive neon accents

In total: 50 texture files, plus 10 ready-to-use Unity Materials (.mat) configured for the Universal Render Pipeline (URP), and one demo scene (Demo_WallShowcase) showing all 10 variants applied to wall geometry.

3. Technical Specifications

Resolution	4096 x 4096 (4K), PNG
Render Pipeline	Universal Render Pipeline (URP) only
Unity Version	Unity 6000.x (developed on 6000.4.9f1)
Workflow	Metallic / Smoothness
Tiling	Verified seamless / tileable

Variants

5 base + 5 damaged = 10 total

4. Installation

- 1 Import the package into your Unity project (Assets > Import Package, or via the Unity Package Manager / Asset Store window).
- 2 Locate the imported Materials in the Materials folder.
- 3 Drag and drop the desired material (for example M_Wall_Industrial_01 or M_Wall_Industrial_01_Damaged) onto a wall object in your scene.
- 4 Open the included demo scene (Demo_WallShowcase) to see a working reference setup.

5. Setup Requirements

- Universal Render Pipeline (URP) must be enabled in the project. The included Materials are built for the URP Lit shader and have not been tested with the Built-in or HDRP render pipelines.
- To see the neon Emission accents glow correctly, a Volume with Bloom enabled must be present in Post-Processing. Without Bloom, the emissive areas will still be visible as a flat bright color, but will not produce a glow effect.
- No custom scripts or shaders are required; this package contains only art assets (textures, materials) and a demo scene.

6. Disclosure of AI-Assisted Content

The BaseColor (albedo) textures were generated with the assistance of Google Gemini 2.5 Flash Image (Vertex AI), using prompts describing a flat, seamless, industrial sci-fi wall panel. All other PBR maps included in this package — Normal, Height, Emission and MaskMap (Metallic / Occlusion / Smoothness) — were calculated algorithmically from the generated BaseColor texture (a Sobel filter for Normal, luminance for Height, color thresholding for Emission and Metallic) without any additional AI involvement. The Unity Materials, the demo scene, and the promotional images were assembled manually / by script in the Unity Editor and through standard image processing, without generating new content with AI.
